Pharmaceutical emulsions/creams are commonly used pharmaceutical products that are primarily prescribed for the treatment of external disorders. In addition to this use emulsions are clinically used for total parenteral nutrition, for the oral administration of therapeutic agents and for the rectal administration of antiepileptic agents.

Suspension (chemistry) - Wikipedia The simplest classification is water-in-oil emulsions and oil-in-water emulsion. A variety of pulsed field gradient nuclear

magnetic resonance (PFG NMR) experiments will be presented, providing data that can be converted into droplet size distributions (DSD), water profiles or surface to volume profiles.

Emulsion Characterisation | SpringerLink • Emulsion is a combination of two immiscible liquids whereas, in a suspension, the two components can be of any phase. • The stability of emulsions can be increased by adding emulsifiers. • The particles in a suspension can be separated by filtering, but particles/droplets in an emulsion cannot be separated by filtering.

Difference Between Emulsion and Suspension | Compare the ... Emulsions and suspensions are intrinsically unstable systems. Creaming of an emulsion or sedimentation of a suspension can be minimised by reducing particle size, increasing the viscosity of the continuous phase or decreasing the density difference between the continuous and disperse phases.
